

Setup Lambok to the STS in mac

Part 2: How to Install MongoDB on Mac

The official and easiest way to install and manage MongoDB on macOS is using **Homebrew** (the Mac package manager).

Step 1: Install Homebrew (If you don't have it)

Paste this command into your Terminal and press Enter:

Bash

```
/bin/bash -c "$(curl -fsSL https://raw.githubusercontent.com/Homebrew/install/HEAD/install.sh)"
```

(If it asks for your Mac password, type it in. Note that characters won't show on the screen while typing passwords in the Terminal—just type it and hit Enter).

```
>> /bin/bash -c "$(curl -fsSL  
https://raw.githubusercontent.com/Homebrew/install/HEAD/install.sh)"
```

Step 2: Download the MongoDB Formula

Run this command to download the official MongoDB Homebrew tap:

Bash

```
brew tap mongodb/brew
```

Step 3: Install MongoDB

Now, install the latest Community Edition of MongoDB by running:

Bash

```
brew install mongodb-community@7.0
```

```
>> brew tap mongodb/brew
```

```
>> brew install mongodb-community@7.0
```

Part 3: How to Start and Run MongoDB

Once installed, MongoDB runs as a background service.

- To START MongoDB:

Bash

```
brew services start mongodb-community@7.0
```

- To STOP MongoDB:

Bash

```
brew services stop mongodb-community@7.0
```

- To check if it's running:

Bash

```
brew services list
```

```
>> brew services start mongodb-community@7.0
```

```
>> brew services stop mongodb-community@7.0
```

```
>> brew services list
```

```
>> mongosh
```
